

产品名称: (+)-氯前列烯醇

产品别名: (+)-Cloprostenol

生物活性:						
Description	(+)-Cloprostenol is a prostaglandin F2 $\alpha$ (PGF2 $\alpha$ ) analogue, and shows selective agonistic activity at the prostaglandin receptor.					
IC <sub>50</sub> & Target	PGF <sub>2<math>\alpha</math></sub>					
In Vitro	D-Cloprostenol and PGF2 alpha are equipotent, about 150 times more potent than dl-cloprostenol ( $P < 0.05$ ) and approximately 280 times more potent than PGE1 in inhibiting [ <sup>3</sup> H]PGF2 alpha binding to corpus luteum cell membranes. However, d-cloprostenol and PGF2 alpha are about 10 times more potent than dl-cloprostenol and approximately 95 times more potent than PGE1 in myometrial cell membranes[2].					
In Vivo	D-cloprostenol (15 g per head) is the lowest dose that consistently achieves abortion; D-cloprostenol causes mild adverse effects including salivation, defecation and hyperventilation in bitches weighing less than 10 kg. Intra-vesicle administration of a single low dose of d-cloprostenol is a safe and successful technique to induce abortion in the bitch[1].
