产品名称: **IMD 0354**  
 产品别名: **IKK2 Inhibitor V**

生物活性:					
<b>Description</b>	IMD-0354 is a selective IKK $\beta$ inhibitor which inhibits NF- $\kappa$ B activity. IMD0354 inhibits TNF- $\alpha$ induced NF- $\kappa$ B transcription activity with an IC <sub>50</sub> of 1.2 $\pm$ 0.3 $\mu$ M.				
<b>IC<sub>50</sub> &amp; Target</b>	IKK $\beta$	NF- $\kappa$ B			
		1.2 $\mu$ M (IC <sub>50</sub> )			
<b>In Vitro</b>	IMD-0354 inhibits NF- $\kappa$ B activity in HMC-1 cells, resulting in complete repression of growth factor-independent proliferation of mast cells. When the DNA-binding activity of NF- $\kappa$ B is inhibited by treatment with IMD-0354, cell proliferation is completely suppressed. HMC-1 cells are incubated with increasing concentrations of IMD-0354 or STI571 for 24, 48, and 72 hours, and numbers and viability of cells are determined by a dye exclusion test and an MTT assay. IMD-0354 suppresses cell proliferation in a time- and dose-dependent manner. The inhibitory effect of IMD-0354 is remarkable, even at lower concentrations, when compared with that of STI571[1]. IMD0354 inhibits TNF- $\alpha$ induced NF- $\kappa$ B transcription activity with an IC <sub>50</sub> of 1.2 $\pm$ 0.3 $\mu$ M[2].				
<b>In Vivo</b>	Daily administration with 5 mg/kg IMD-0354 significantly suppresses tumor expansion in nude mice implanted with established MDA-MB-231 tumors. In mice treated with IMD-0354, tumor progression is restrained[3]. The number of infiltrating cells in aqueous humor is 53.6 $\pm$ 9.8 $\times$ 10 <sup>5</sup> , 72.5 $\pm$ 17.0 $\times$ 10 <sup>5</sup> , 127.25 $\pm$ 32.0 $\times$ 10 <sup>5</sup> , and 132.0 $\pm$ 25.0 $\times$ 10 <sup>5</sup> cells/mL in rats treated with 30, 10, 3, or 0 mg/kg of IMD-0354, respectively. The total protein concentrations of aqueous humor are 92.6 $\pm$ 3.1 mg/mL, 101.5 $\pm$ 6.8 mg/mL, 112.6 $\pm$ 1.9 mg/mL, and 117.33 $\pm$ 1.8 mg/mL in rats treated with 30, 10, 3, and 0 mg/kg of IMD-0354, respectively[4].				
<b>Solvent&amp;Solubility</b>	<b>In Vitro:</b> DMSO : $\geq$ 100 mg/mL (260.64 mM) H <sub>2</sub> O : < 0.1 mg/mL (insoluble) * " $\geq$ " means soluble, but saturation unknown.

<p><b>实验参考:</b></p>	
<p><b>Cell Assay</b></p>	<p>HMC-1 cells (<math>2 \times 10^5</math> cells/mL) are incubated with various concentrations of IMD-0354 (0.1, 0.5, 1, 5 and 10 <math>\mu</math>M), STI571, or pyrrolidine dithiocarbamate (PDTC) for the indicated hours, and viable cell numbers are calculated with the use of the trypan blue dye exclusion test at each time point. Cells (<math>2 \times 10^5</math> cells/mL) are incubated in phenol red free <math>\alpha</math>-MEM containing 10% FCS (for HMC-1 and IC-2 cells) or 5% FCS (for CBhCMCs), and antibiotics with or without various concentrations of IMD-0354 (0.1, 0.5, 1, 5 and 10 <math>\mu</math>M), STI571, or PDTC. IC-2<sup>WT</sup> cells and CBhCMCs are incubated in the presence of 100 ng/mL recombinant rat or recombinant human SCF. One hundred microliters of cell suspension is applied to each well of 96-well culture plates and are incubated for 24, 48, and 72 hours. Before 4 hours from the end of the culture, 10 <math>\mu</math>L of 5 mg/mL MTT dissolved in PBS is added to each well. The reaction is stopped with the addition of 100 <math>\mu</math>L of 10% SDS in 0.01 N HCl. Absorbance is measured at 577 nm with ImmunoMini NJ-2300[1].</p>
<p><b>Animal Administration</b></p>	<p>Mice[3]</p> <p>MDA-MB-231 cells are suspended in PBS (<math>5 \times 10^6</math> cells/100 <math>\mu</math>L mouse) and s.c. injected to the back of female BALB/c nude mice at the age of 4 to 5 weeks. After growth, the tumor is removed surgically and 100 mg of each established tumor is transplanted to the back of other female nude mice at the age of 4 weeks under ether anesthesia. IMD-0354 is suspended in saline and 5 mg/kg body weight IMD-0354 (suspended in 100 <math>\mu</math>L/mouse) is given to each mouse by i.p. injection once a day for 28 days after the implantation. Saline is injected in nude mice as a control. Estimated tumor volume (mm<sup>3</sup>) and tumor weight (mg) are calculated.</p>

	<p>Rats[4] Eight-week-old male Lewis rats (180-220 g) are used. Endotoxin-induced uveitis (EIU) is induced with subcutaneous injection with 200 µg LPS from <i>Escherichia coli</i> that has been diluted in 200 µL PBS. At the same time, the rats are injected intraperitoneally with 30, 10, or 3 mg/kg of IMD-0354, diluted in 500 µL of 0.5% CMC. Control EIU rats are intraperitoneally administered 500 µL of CMC alone. Naïve rats are used as controls. All experiments are performed in triplicate with five animals in each group.</p>
