产品名称: 加米霉素
 产品别名: **Gamithromycin; ML-1709460**

| 生物活性: | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|---|---------------|-----------|-----------|------------|------|-------|---------------|------|-----------------|-------|--|-----------|-----------|------------|------|--|-----------|-----------|-----------|-------|--|-----------|-----------|-----------|
| Description | Gamithromycin is an antimicrobial agent which can inhibit the growth of <i>MmmSC</i> strains B237 and Tan8 with MICs of 0.00012 and 0.00006 µg/mL, respectively. | | | | | | | | | | | | | | | | | | | | | | | | |
| IC₅₀ & Target | MIC: 0.00012 µg/mL (<i>MmmSC</i> strain B237), 0.00006 µg/mL (<i>MmmSC</i> strain Tan8)[1] | | | | | | | | | | | | | | | | | | | | | | | | |
| In Vitro | The MIC values in serum are significantly lower than those in artificial medium; at an initial inoculum size of 10 ⁶ cfu/mL, these are 64-, 8- and 64-fold lower for gamithromycin, tylosin and tilmicosin, respectively, against <i>MmmSC</i> strain B237 in serum compare to artificial medium. A similar pattern emerges for Tan8. Heat-inactivation of serum results in an MIC for gamithromycin that is higher than in either non-treated serum or artificial medium ^[1] . | | | | | | | | | | | | | | | | | | | | | | | | |
| In Vivo | The proportion of foals that recover without the need for a change in treatment is significantly ($P < 0.048$) higher for foals treated with Gamithromycin (GAM) (38 of 40; 95%) or AZM-RIF (39 of 40; 98%) compare to control foals (32 of 41; 78%). The clinical scores, number of abscesses and the abscess scores after 1 and 2 weeks of treatment are significantly lower for foals treated with Gamithromycin (GAM) or AZM-RIF compare to control foals. The WBC count of foals treated with Gamithromycin (GAM) is significantly higher than that of foals treated with AZM-RIF on week 3 of treatment ^[2] . | | | | | | | | | | | | | | | | | | | | | | | | |
| Solvent&Solubility | In Vitro: DMSO : 160 mg/mL (205.91 mM; Need ultrasonic and warming) | | | | | | | | | | | | | | | | | | | | | | | | |

| Cell Assay | Minimum inhibitory concentrations (MICs) for gamithromycin, tylosin and tilmicosin against <i>MmmSC</i> strains B237 and Tan8 are determined using a macrodilution technique. Equal volumes of <i>MmmSC</i> culture in logarithmic phase are added to each antimicrobial dilution to give an inoculum size of 10 ⁷ cfu/mL, i.e. the intending initial titre for subsequent time-kill assays, in a volume of 4 mL. Cultures are incubated for 24 h at 37°C. At 0 and 24 h time points, samples are removed and serially diluted 10-fold down to 10 ⁻⁵ . Aliquots (10 µL) of each dilution are transferred to solid | | | | | | | | | | | | | | | | | | | | | | | | |

|------------------------------|---|
| | <p>medium; after incubation at 37°C in a humidified atmosphere of 5% carbon dioxide in air for at least 4 days, colonies are counted from the dilution that yields between 30 and 300 colonies per plate. Counts are converted into cfu/mL and MIC is defined as the lowest concentration of antimicrobial that prevents an increase in cfu/mL over 24 h^[1].</p> |
| Animal Administration | <p>Foals with ultrasonographic evidence of pulmonary abscesses are randomly assigned in 3 treatment groups: (1) gamithromycin at a dose of 6.0 mg/kg body weight is administered in the semimembranosus/semitendinosus muscles once a week (GAM; n=40); (2) azithromycin at a dose of 10 mg/kg PO once daily in combination with rifampin at a dose of 10 mg/kg PO once daily (AZM-RIF; n=40); and (3) no antimicrobial treatment (controls; n=41). All the foals in each treatment group also receive acetylcysteine at a dose of 10 mg/kg PO a day to provide the same daily manipulation of the foals in each group^[2].</p> |
